Working Paper

The Center for Growth and Opportunity at Utah State University is a university-based academic research center that explores the scientific foundations of the interaction between individuals, business, and government.

This working paper represents scientific research that is intended for submission to an academic journal. The views expressed in this paper are those of the author(s) and do not necessarily reflect the views of the Center for Growth and Opportunity at Utah State University or the views of Utah State University.

^a Christopher Cox is the co-author of Section 230 with US Senator Ron Wyden (Rep. Wyden at the time). During a 23-year Washington career, he was a White House counsel to President Ronald Reagan, chairman of the US Securities and Exchange Commission, chairman of the Homeland Security Committee in the US House of Representatives, and the fifth-ranking elected leader in the House.

Introduction

Since 1996, Section 230 of the Communications Decency Act has governed the allocation of liability for online torts and crimes among internet content creators, platforms, and service providers.¹ As will be seen, the intent of Congress—often an elusive concept, given the difficulty of encapsulating the motives of 535 policymakers with competing partisan perspectives—is more readily apprehended in this case, given the widespread support that Section 230 received from both sides of the aisle. That intent is clearly expressed in the plain language of the statute and runs counter to much of the 21st century narrative about the law. The statute’s fundamental principle is that content creators should be liable for any illegal content they create. Internet platforms are generally protected from liability for third-party content, unless they are complicit in the creation or development of illegal content, in which case the statute offers them no protection.

Prior to the enactment of Section 230, the common law had developed a different paradigm. New York courts took the lead in deciding that an internet platform would bear no liability for illegal content created by its users. This protection from liability, however, did not extend to a platform that moderated user-created content. Instead, only if a platform made no effort to enforce rules of online behavior would it be excused from liability for its users’ illegal content. This created a perverse incentive. To avoid open-ended liability, internet platforms would need to adopt what the New York Supreme Court called the “anything goes” model for user-created content. Adopting and enforcing rules of civil behavior on the platform would automatically expose the platform to unlimited downside risk.²

The decision by the US Congress to reverse this unhappy result through Section 230, enacted in 1996, has proven enormously consequential. By providing legal certainty for platforms, the law has enabled the development of innumerable internet business models based on user-created content. It has also protected content moderation, without which platforms could not even attempt to enforce rules of civility, truthfulness, and conformity with law. At the same time, some courts have extended Section 230 immunity to internet platforms that seem complicit in illegal behavior, generating significant controversy about both the law’s intended purpose and its application.³ Further controversy has been generated as a result of public debate over the role that the largest internet platforms, including social media giants Facebook, Twitter, and YouTube, play in America’s political and cultural life through their content moderation policies.

The increasing controversy has led to numerous efforts to amend Section 230 that are now pending in Congress.⁴ On one side of the debate over the future of the law are civil libertarians, including the American Civil Liberties Union, who oppose amending Section 230 because they see it as the reason platforms can host critical and controversial speech without constant fear of suit.⁵ They are joined in opposition to amending Section 230 by supporters of responsible content moderation, which would be substantially curtailed or might not exist at all in the absence of protection from

liability.⁶ Others concerned with government regulation of speech on the internet, including both civil libertarians and small-government conservatives, are similarly opposed to changing the law.⁷

On the other side of the debate, pressing for reform of Section 230, are proponents of treating the largest internet platforms as the “public square,”⁸ which, under applicable Supreme Court precedent, would mean that all speech protected by the First Amendment must be allowed on those platforms.⁹ (Section 230, in contrast, protects a platform’s content moderation “whether or not such material is constitutionally protected.”)¹⁰ Others in favor of amending Section 230 argue that internet platform immunity from suit over user-created content should come with conditions: for example, providing law enforcement access to encrypted data from their customers’ cell phones and computers,¹¹ or proving that they are taking aggressive steps to screen user-created content for illegal material.¹² Further support for amending Section 230 has come from opponents of “Big Tech” on both ends of the political spectrum who are unhappy with the moderation practices of the largest platforms. During the 2020 presidential campaign, Joe Biden called for repeal of Section 230, citing Facebook’s refusal to take down ads claiming he had conditioned U.S. assistance to Ukraine on its firing a prosecutor investigating a company with ties to Biden’s son.¹³ At the same time, House Speaker Nancy Pelosi complained that social media did too little to weed out Russian disinformation.¹⁴ Meanwhile, the Trump administration railed against too much “censorship” by social media platforms.¹⁵ Both groups see Section 230 as unfairly insulating the platforms from lawsuits challenging their current moderation practices.¹⁶

The sponsors of the several bills that have been introduced in both the House and the Senate during the 116th Congress (2019–21) and the 117th Congress (2021–23) to amend Section 230 have emphasized the original purposes of the law while maintaining that court decisions and the conduct of the large internet platforms have distorted what Congress originally intended.¹⁷ This has brought the history of Section 230’s original enactment into sharp focus, making the actual record of its birth and odyssey from idea into law relevant to both policymakers and courts. In this article, I recount the circumstances that led me to write this legislation in 1995, and the work that my original co-sponsor, then-US Representative Ron Wyden (D-OR), and I did to win its passage. Finally, I describe how the original intent of the law, as interpreted in the courts during the intervening decades, has been reflected in the actual application of Section 230 to the circumstances of the modern internet.

The Communications Decency Act, S. 314

It was a hot, humid Washington day in the summer of 1996 when James Exon (D-NE), standing at his desk on the Senate floor, read the following prayer into the record as a prelude to passage of his landmark legislation¹⁸ that would be the first ever to regulate content on the internet:

Almighty God, Lord of all life, we praise You for the advancements in computerized communications that we enjoy in our time. Sadly, however, there are those who are littering this information superhighway with obscene, indecent, and destructive pornography. ... Lord, we are profoundly concerned about the impact of this on our children. ... Oh God, help us care for our children. Give us wisdom to create regulations that will protect the innocent.¹⁹

Immediately following his prayer, Senator Exon found it had been answered in the form of his own proposal to ban anything unsuitable for minors from the internet. His bill, as originally introduced, authorized the Federal Communications Commission to adopt and enforce regulations that would limit what adults could access, say, or write online to material suitable for children. Anyone who posted any “indecent” communication, including any “comment, request, suggestion, proposal, [or] image” that was viewable by “any person under 18 years of age,” would become criminally liable, facing both jail and fines.²⁰

The Exon dragnet was cast wide: not only would the content creator—the person who posted the article or image that was unsuitable for minors—face jail and fines, but the bill made the mere transmission of such content criminal as well.²¹ Meanwhile, internet service providers would be exempted from civil or criminal liability for the limited purpose of eavesdropping on customer email in order to prevent the transmission of potentially offensive material.

Like his Nebraska forebear William Jennings Bryan, who passionately defended creationism at the infamous Scopes “Monkey Trial,” James Exon was not known for being on the cutting edge of science and technology. His motivation to protect children from harmful pornography was

¹⁷ See, for example, Josh Hawley, “The True History of Section 230,” n.d., <https://www.hawley.senate.gov/sites/default/files/2020-06/true-history-section-230.pdf>.

²¹ CDA §2.

pure, but his grasp of the rapidly evolving internet was sorely deficient. Nor was he alone: a study completed that same week revealed that of senators who voted for his legislation, 52 percent had no internet connection.²² Unfamiliarity with the new technology they were attempting to regulate had immediate side effects. What many of these senators failed to grasp was how different the internet was from the communications technologies with which they were familiar and had regulated through the Federal Communications Commission for decades.

Broadcast television had long consisted of three networks, and even with the advent of cable, the content sources were relatively few and all the millions of viewers were passive. The same was true of radio. For years there had been one phone company, and by the 1990s there were only a handful more. The locus of all of this activity was domestic, within the jurisdiction and control of the United States. None of this bore any relation to the internet. On this new medium, the number of content creators—each a “broadcaster,” as it were—was the same as the number of users. It would soon expand from hundreds of millions to billions. It would be impossible for the federal government to prescreen all the content that so many people were creating all day, every day. And there was the fact that the moniker “World Wide Web” was entirely apt, since the internet functions globally. It was clear to many, even then, that most of the content creation would ultimately occur outside the jurisdiction of federal authorities and that enforcement of Exon-like restrictions in the United States would simply push the sources of the banned content offshore.

Above all, the internet was unique in that communications were instantaneous: the content creators could interact with the entire planet without any intermediation or lag time. In order for censors to intervene, they would have to destroy the real-time feature of the technology that made it so useful.

Not everyone in the Senate was enthusiastic about the Exon bill. The chairman of the Senate Commerce Committee, Larry Pressler, a South Dakota Republican, chose not to include it in his proposed committee version of the Telecommunications Act.²³ Vermont Senator Patrick Leahy, the ranking Democrat on the Judiciary Committee’s Antitrust, Business Rights, and Competition subcommittee, opposed it for a prescient reason: the law of unintended consequences. “What I worry about, is not to protect pornographers,” Leahy said. “Child pornographers, in my mind, ought to be in prison. The longer the better. I am trying to protect the Internet, and make sure that when we finally have something that really works in this country, that we do not step in and screw it up, as sometimes happens with government regulation.”²⁴

But Exon was persistent in pursuing what he called the most important legislation of his career. He went so far as to lobby his colleagues on the Senate floor by showing them the hundreds of lewd pictures he had collected in his “blue book,” all downloaded from the web and printed out in color.²⁵ It made *Playboy* and *Penthouse* “pale in offensiveness,” he warned them.²⁶ The very day he

22 Robert Cannon, “The Legislative History of Senator Exon’s Communications Decency Act: Regulating Barbarians on the Information Superhighway,” *Federal Communications Law Journal* 49, no. 1 (1996): 51, 71–72 n.103.

23 “Cyber Liberties Alert from the ACLU,” March 23, 1995, <http://webcache.googleusercontent.com/search?q=cache:drreHQ6UHLAJ:besser.tsoa.nyu.edu/impact/w95/RN/mar24news/Merc-news-cdaupdate.html&chl=en&gl=us&strip=0&vwsr=1>. When the Exon bill was offered as an amendment to the Telecommunications Act in the Commerce Committee, Chairman Pressler first moved to table it; when the motion to table was defeated, the amendment was approved on a voice vote.

25 104th Cong., 1st Sess., 141 Cong. Rec. Pt. 11, 15503-04 (June 9, 1995)(remarks of Sen. Exon, describing his “blue book”).

26 104th Cong., 1st Sess., 141 Cong. Rec. Pt. 11, 16009 (June 14, 1995)(remarks of Sen. Exon).

offered his prayer, the Senate debated whether to add an amended version of Exon's legislation²⁷ to a much larger bill pending in Congress.²⁸ This was the first significant overhaul of telecommunications law in more than 60 years, a thorough-going revision of the Communications Act of 1934. Though that overhaul was loaded with significance, the pornography debate—broadcast live on C-SPAN, then still a novelty—is what caught the public's attention.

During that brief debate, breathless speeches conjuring lurid images of sordid sex acts overwhelmed academic points about free speech, citizens' privacy rights, and the way the internet's packet-switched architecture actually works. The threat posed to the internet itself by Exon's vision of a federal speech police paled into irrelevance. With millions of people watching, senators were wary of appearing as if they did not support protecting children from pornography. The lopsided final tally on Exon's amendment to the Telecommunications Act showed it. The votes were 84 in favor, 16 opposed.²⁹

The Internet Freedom and Family Empowerment Act, H.R. 1978

When it came to familiarity with the internet, the House of Representatives was only marginally more technologically conversant than the Senate. While a handful of members were conversant with "high tech," as it was called, most were outright technophobes, quite comfortable with the old ways of doing things. Many of the committee chairs, given the informal seniority system in the House, were men in their 70s. They saw little need for improvement in the tried-and-true protocols of paper files in folders, postcards and letters on stationery, and the occasional phone call. The Library of Congress was filled with books, so there was no apparent need for any additional sources of information.

On the day Exon's bill passed the Senate, more than half of the senators (including Senator Exon) did not even have an email address.³⁰ In the House it was worse: only 26 percent of members had an email address.³¹ The conventional wisdom was that, with the World's Greatest Deliberative Body having spoken so definitively, the House would follow suit. And for the same reason: with every House member's election just around the corner, none would want to appear weak on pornography. The near-unanimous Senate vote seemed dispositive of the question.

While it is often the case that the House legislates impulsively while the Senate takes its time, in this case the reverse happened. As chairman of the House Republican Policy Committee—and someone who built his own computers and had been using the internet for years—I took a serious interest in the issue. After some study of Exon's legislation, I had already decided to write my own bill as an alternative. Fortuitously, I was a member of the Energy and Commerce Committee, which on the House side had jurisdiction over the Telecommunications Act to which Exon had attached his bad idea.

27 The amendment was intended to address criticisms that the Communications Decency Act was overbroad. It provided a narrow defense in cases where the defendant "solely" provides internet access, thereby continuing to expose all websites hosting user-created content to uncertain criminal liability. 104th Cong., 1st Sess., 141 Cong. Rec. Pt. 11, 16007 (June 14, 1995)(remarks of Sen. Exon).

28 S. 652, Telecommunications Competition and Deregulation Act of 1995 (March 30, 1995).

30 Cannon, "Legislative History."

31 Cannon, "Legislative History."

One of the tech mavens in the House at the time was Ron Wyden, a liberal Democrat from Oregon whose Stanford education and activist streak (he had run the Gray Panthers advocacy group in his home state during the 1970s) made him a perfect legislative partner. The two of us had recently shared a private lunch and bemoaned the deep partisanship in Congress that mostly prevented Democrats and Republicans from writing legislation together. We decided this was due to members flogging the same old political hot-button questions on which everyone had already made up their minds.

At the conclusion of our lunch, we decided to look for cutting-edge issues that would present novel and challenging policy questions, to which neither we nor our colleagues would have a knee-jerk response. Then, after working together to address the particular issue with a practical solution, we would work to educate members on both sides, and work for passage of truly bipartisan legislation. It was not much longer afterward that the question of regulating speech on the internet presented itself, and Rep. Wyden and I set to work.

Soon thereafter, *Time* magazine reported that “the balance between protecting speech and curbing pornography seemed to be tipping back toward the libertarians.” They noted that “two US Representatives, Republican Christopher Cox of California and Democrat Ron Wyden of Oregon, were putting together an anti-Exon amendment that would bar federal regulation of the internet and help parents find ways to block material they found objectionable.”³²

We named our bill the Internet Freedom and Family Empowerment Act, to describe its two main components: protecting speech and privacy on the internet from government regulation, and incentivizing blocking and filtering technologies that individuals could use to become their own censors in their own households. Pornographers illegally targeting minors would not be let off the hook; they would be liable for compliance with all laws, both civil and criminal, in connection with any content they created. To avoid interfering with the essential functioning of the internet, the law would not shift that responsibility to internet platforms, for whom the burden of screening billions of digital messages, documents, images, and sounds would be unreasonable—not to mention a potential invasion of privacy. Instead, internet platforms would be allowed to act as “Good Samaritans” by reviewing at least some of the content if they chose to do so in the course of enforcing rules against “obscene, lewd, lascivious, filthy, excessively violent, harassing, or otherwise objectionable” content.³³

This last feature of the bill resolved a conflict that then existed in the courts. In New York, a judge had held that one of the then-two leading internet platforms, Prodigy, was liable for defamation because an anonymous user of its site had claimed that an investment bank and its founder, Jordan Belfort, had committed securities fraud. (The post was not defamatory: Belfort was later convicted of securities fraud, but not before Prodigy had settled the case for a substantial figure. Belfort would achieve further infamy when he became the model for Leonardo DiCaprio’s character in *The Wolf of Wall Street*.)³⁴

32 Philip Elmer-DeWitt, “Cyberporn—On a Screen Near You,” *Time*, July 3, 1995, 38.

33 Internet Freedom and Family Empowerment Act, H.R. 1978, 104th Cong., 1st Sess. (June 30, 1995) (“IFFEA”).

34 Conor Clark, “How the Wolf of Wall Street Created the Internet,” January 7, 2014, <https://slate.com/news-and-politics/2014/01/the-wolf-of-wall-street-and-the-stratton-oakmont-ruling-that-helped-write-the-rules-for-the-internet.html>.

In holding Prodigy responsible for content it did not create, the court effectively overruled a prior New York decision involving the other major US internet platform at the time, CompuServe.³⁵ The previous case held that online service providers would not be held liable as publishers. In distinguishing *Prodigy* from the prior precedent, the court cited the fact that Prodigy, unlike CompuServe, had adopted content guidelines. These requested that users refrain from posts that are “insulting” or that “harass other members” or “are deemed to be in bad taste or grossly repugnant to community standards.” The court further noted that these guidelines expressly stated that although “Prodigy is committed to open debate and discussion on the bulletin boards ... this doesn’t mean that ‘anything goes.’”³⁶

CompuServe, in contrast, made no such effort. On its platform, the rule was indeed “anything goes.” As a user of both services, I well understood the difference. I appreciated the fact that there was some minimal level of moderation on the Prodigy site. While CompuServe was a splendid service and serious users predominated, the lack of any controls whatsoever was occasionally noticeable and, I could easily envision, bound to get worse.

If allowed to stand, this jurisprudence would have created a powerful and perverse incentive for platforms to abandon any attempt to maintain civility on their sites. A legal standard that protected only websites where “anything goes” from unlimited liability for user-generated content would have been a body blow to the internet itself. Rep. Wyden and I were determined that good-faith content moderation should not be punished, and so the Good Samaritan provision in the Internet Freedom and Family Empowerment Act was born.³⁷

In the House leadership, of which I was then a member, there were plenty of supporters of our effort. The new Speaker, Newt Gingrich, had long considered himself a tech aficionado and had already proven as much by launching the THOMAS project at the Library of Congress to digitize congressional records and make them available to the public online. He slammed the Exon approach as misguided and dangerous. “It is clearly a violation of free speech, and it’s a violation of the right of adults to communicate with each other,” the Speaker of the House said at the time, adding that Exon’s proposal would dumb down the internet to what censors believed was acceptable for children to read. “I don’t think it is a serious way to discuss a serious issue,” he explained, “which is, how do you maintain the right of free speech for adults while also protecting children in a medium which is available to both?”³⁸

Rep. Dick Armey (R-TX), then the new House Majority Leader, joined the Speaker in supporting the Cox-Wyden alternative to Exon. So did California’s David Dreier (R-CA), the Chairman of the House Rules Committee, who was closely in touch with the global high-tech renaissance being led by innovators in his home state. They were both Republicans, but my fellow Californian Nancy Pelosi, not yet a member of the Democratic leadership, weighed in as well, noting that Exon’s approach would have a chilling effect on serious discussion of HIV-related issues.³⁹

38 Edmund L. Andrews, “Gingrich Opposes Smut Rule for Internet,” *New York Times*, June 22, 1995, A20.

39 104th Cong., 2nd Sess., 142 Cong. Rec. H1173 (Daily Ed. February 1, 1996)(statement of Rep. Pelosi).

In the weeks and months that followed, Rep. Wyden and I conducted outreach and education among our colleagues in both the House and Senate on the challenging issues involved. It was a rewarding and illuminating process, during which we built not only overwhelming support, but also a much deeper understanding of the unique aspects of the internet that require clear legal rules for it to function.

Two months after Senator Exon successfully added his Communications Decency Act to the Telecommunications Act in the Senate, the Cox-Wyden measure had its day in the sun on the House floor.⁴⁰ Whereas Exon had begun with a prayer, Rep. Wyden and I began on a wing and prayer, trying to counter the seemingly unstoppable momentum of a near-unanimous Senate vote. But on this day in August, the debate was very different than it had been across the Rotunda.

Speaker after speaker rose in support of the Cox-Wyden measure, and condemned the Exon approach. Rep. Zoe Lofgren (D-CA), the mother of 10- and 13-year-old children, shared her concerns with internet pornography and noted that she had sponsored legislation mandating a life sentence for the creators of child pornography. But, she emphasized, “Senator Exon’s approach is not the right way ... it will not work.” It was, she said, “a misunderstanding of the technology.”⁴¹ Rep. Bob Goodlatte, a Virginia Republican, emphasized the potential the internet offered and the threat to that potential from Exon-style regulation. “We have the opportunity for every household in America, every family in America, soon to be able to have access to places like the Library of Congress, to have access to other major libraries of the world, universities, major publishers of information, news sources. There is no way,” he said, “that any of those entities, like Prodigy, can take the responsibility to edit out information that is going to be coming in to them from all manner of sources.”⁴²

In the end, not a single representative spoke against the bill. The final roll call on the Cox-Wyden amendment was 420 yeas, 4 nays.⁴³ It was a resounding rebuke to the Exon approach in his Communications Decency Act. The House then proceeded to pass its version of the Telecommunications Act—with the Cox-Wyden amendment, and without Exon.⁴⁴

The Telecommunications Act of 1996

The Telecommunications Act, including the Cox-Wyden amendment, would not be enacted until the following year. In between came a grueling House-Senate conference that was understandably more concerned with resolving the monumental issues in this landmark modernization of FDR-era telecommunications regulation. During the extended interlude, Rep. Wyden and I, along with our now much-enlarged army of bipartisan, bicameral supporters, continued to reach out in discussions with members about the novel issues involved and how best to resolve them. This resulted in some final improvements to our bill and ensured its inclusion in the final House-Senate conference report.

43 104th Cong., 1st Sess., 141 Cong. Rec. Part 16, 22054 (August 4, 1995).

44 The Communications Act of 1995, H.R.1555, was approved in the House by a vote of 305-117 on August 4, 1995. 104th Cong., 1st Sess., 141 Cong. Rec. Part 16, 22084 (August 4, 1995).

But political realities as well as policy details had to be dealt with. There was the sticky problem of 84 senators having already voted in favor of the Exon amendment. Once on record with a vote one way—particularly a highly visible vote on the politically charged issue of pornography—it would be very difficult for a politician to explain walking it back. The Senate negotiators, anxious to protect their colleagues from being accused of taking both sides of the question, stood firm. They were willing to accept Cox-Wyden, but Exon would have to be included, too. The House negotiators, all politicians themselves, understood. This was a Senate-only issue, which could be easily resolved by including both amendments in the final product. It was logrolling at its best.⁴⁵

President Clinton signed the Telecommunications Act of 1996 into law in February at a nationally televised ceremony from the Library of Congress Reading Room, where he and Vice President Al Gore described the bill as paving the way for the “information superhighway” of the internet.⁴⁶ There was no mention of Exon’s Communications Decency Act. But there was a live demonstration of the internet’s potential as a learning tool, including a live hookup with high school students in their classroom. And the president pointedly objected to the new law’s criminalization of transmission of any “indecent” material, predicting that these provisions would be found violative of the First Amendment and unenforceable.⁴⁷

Almost before the ink was dry and the signing pens handed out to the VIPs at the ceremony, the Communications Decency facet of the new law faced legal challenges. By summer, multiple federal courts had enjoined its enforcement.⁴⁸ The following summer the US Supreme Court delivered its verdict with the same spirit that had characterized its House rejection.⁴⁹ The court (then consisting of Chief Justice Rehnquist and Associate Justices Stephens, O’Connor, Souter, Kennedy, Thomas, Ginsburg, and Breyer), unanimously held that “[i]n order to deny minors access to potentially harmful speech, the CDA effectively suppresses a large amount of speech that adults have a constitutional right to receive and to address to one another. That burden on adult speech is unacceptable.”⁵⁰

The court’s opinion cited Senator Patrick Leahy’s comment that in enacting the Exon amendment, the Senate “went in willy-nilly, passed legislation, and never once had a hearing, never once had a discussion other than an hour or so on the floor.”⁵¹ It noted that transmitting obscenity and child pornography, whether via the internet or other means, was already illegal under federal law for both adults and juveniles, making the draconian Exon restrictions on speech unreasonable overkill.⁵² And there was more: under the Exon approach, the high court pointed out, any opponent of particular internet content would gain “broad powers of censorship, in the form of a ‘heckler’s veto.’” He or she “might simply log on and inform the would-be discourses that his 17-year-old

45 Senator Patrick Leahy, a leading proponent of the Cox-Wyden amendment and opponent of Senator Exon’s Communications Decency Act, had warned against this logically inconsistent approach. I joined him in what he termed the “easy compromise” that would include both Exon and Cox-Wyden in the Conference Report.

child” was also online. The standard for what could be posted in that forum, chat room, or other online context would immediately be reduced to what was safe for children to see.⁵³

In defenestrating Exon, the court was unsparing in its final judgment. The amendment was worse than “burn[ing] the house to roast the pig.” It cast “a far darker shadow over free speech, threaten[ing] to torch a large segment of the Internet community.” Its regime of “governmental regulation of the content of speech is more likely to interfere with the free exchange of ideas than to encourage it.”⁵⁴

With that, Senator Exon’s deeply flawed proposal finally died. In the Supreme Court, Rep. Wyden and I won the victory that had eluded us in the House-Senate conference.

One irony, however, persists. When legislative staff prepared the House-Senate conference report on the final Telecommunications Act, they grouped both Exon’s Communications Decency Act and the Internet Freedom and Family Empowerment Act into the same legislative title. So the Cox-Wyden amendment became Section 230 of the Communications Decency Act—the very piece of legislation it was designed to rebuke. Today, with the original Exon legislation having been declared unconstitutional, it is that law’s polar opposite which bears Senator Exon’s label.

Congressional Intent in Practice: How Section 230 Works

By 1997, with the Communications Decency Act erased from the future history of the internet, Section 230 had already achieved one of its fundamental purposes. In contrast to the Communications Decency Act, which was punitive, heavily regulatory, and government directed, Section 230 focused on enabling user-created content by providing clear rules of legal liability for website operators that host it. Platforms that are not involved in content creation were to be protected from liability for content created by third-party users.

This focus of Section 230 proceeded directly from our appreciation of what was at stake for the future of the internet. As the debate on the Cox-Wyden amendment to the Telecommunications Act made clear, the bill’s authors and a host of members on both sides of the aisle all understood that without such protection from liability, websites would be exposed to lawsuits for everything from users’ product reviews to book reviews. In 21st century terms, this would mean that Yelp would be exposed to lawsuits for its users’ negative comments about restaurants, and Trip Advisor could be sued for a user’s disparaging review of a hotel. Indeed any service that connects buyers and sellers, workers and employers, content creators and a platform, victims and victims’ rights groups—or provides any other interactive engagement opportunity one can imagine—would face open-ended liability if it continued to display user-created content.

In the years since the enactment of Section 230, in large measure due to a legal framework that facilitates the hosting of user-created content, such content has come to typify the modern internet. Not only have billions of internet users become content creators, but equally they have become reliant upon content created by other users. Contemporary examples abound. In 2020, many in the United States contending with the deadliest tornado season since 2011 could not have located

53 Reno v. ACLU, 521 U.S. 880 (1997).

54 Reno v. ACLU, 521 U.S. 882 (1997).

their loved ones without user-created content.⁵⁵ Every day, millions of Americans rely on instructional videos for everything from healthcare to home maintenance.⁵⁶ During the COVID-19 crisis, online access to user-created pre-K, primary, and secondary education and lifelong learning resources proved a godsend for families across the country and around the world.⁵⁷ More than 86 percent of US businesses with websites rely on user-created content, making the operation of Section 230 essential to ordinary commerce.⁵⁸ The vast majority of Americans feel more comfortable buying a product after researching user-generated reviews,⁵⁹ and over 90 percent of consumers find user-generated content helpful in making their purchasing decisions.⁶⁰ User-generated content is equally vital to law enforcement and social services.⁶¹ Following the rioting in several US cities in 2020, social workers were able to match people with supplies and services to victims who needed life-saving help, directing them with real-time maps.⁶²

Creating a legal environment hospitable to user-created content required that Congress strike the right balance between opportunity and responsibility. Section 230 is such a balance, holding content creators liable for illegal activity while protecting internet platforms from liability for content created entirely by others. Most important to understanding the operation of Section 230 is that it does not protect platforms from liability when they are complicit—even if only in part—in the creation or development of illegal content.

The plain language of Section 230 makes clear its deference to criminal law. The entirety of federal criminal law enforcement is unaffected by Section 230.⁶³ So is all of state law that is consistent with the policy of Section 230.⁶⁴ Still, state law that is inconsistent with the aims of Section 230 is preempted.⁶⁵ Why did Congress choose this course? First, and most fundamentally, it is because the essential purpose of Section 230 is to establish a uniform federal policy, applicable across the internet, that avoids results such as the state court decision in *Prodigy*. The internet is the quintessential vehicle of interstate and indeed international commerce. Its packet-switched architecture makes it uniquely susceptible to multiple sources of conflicting state and local regulation, since

63 47 U.S.C. § 230(e)(1) provides: “*No effect on criminal law.* Nothing in this section shall be construed to impair the enforcement of section 223 or 231 of this title, chapter 71 (relating to obscenity) or 110 (relating to sexual exploitation of children) of title 18, or any other Federal criminal statute” (emphasis added).

64 47 U.S.C. § 230(e)(3) provides: “*State law.* Nothing in this section shall be construed to prevent any State from enforcing any State law that is consistent with this section” (emphasis added).

65 47 U.S.C. § 230(e)(3) further provides: “No cause of action may be brought and no liability may be imposed under any State or local law that is inconsistent with this section.”

even a message from one cubicle to its neighbor inside the same office can be broken up into pieces and routed via servers in different states. Were every state free to adopt its own policy concerning when an internet platform will be liable for the criminal or tortious conduct of another, not only would compliance become oppressive, but the federal policy itself could also be quickly undone. All a state would have to do to defeat the federal policy would be to place platform liability laws in its criminal code. Section 230 would then become a nullity. Congress thus intended Section 230 to establish a uniform federal policy, but one that is entirely consistent with robust enforcement of state criminal and civil law.

Despite the necessary preemption of inconsistent state laws, Section 230 is constructed in such a way that every state prosecutor and every civil litigant can successfully target illegal online activity by properly pleading that the defendant was at least partially involved in the creation of illegal content, or at least the later development of it. In all such cases, Section 230 immunity does not apply. In this respect, statutory form clearly followed function: Congress intended that this legislation would provide no protection for any website, user, or other person or business involved even in part in the creation or development of content that is tortious or criminal. This specific intent is clearly expressed in the definition of “information content provider” in subsection (f)(3) of the statute.⁶⁶

In the two and a half decades Section 230 has been on the books, there have been hundreds of court decisions interpreting and applying it. It is now firmly established in the case law that Section 230 cannot act as a shield whenever a website is in any way complicit in the creation or development of illegal content. In the landmark en banc decision of the Ninth Circuit Court of Appeals in *Fair Housing Council of San Fernando Valley v. Roommates.com*,⁶⁷ which has since been widely cited and applied in circuits across the United States, it was held that websites lose their immunity not only when they merely “develop” content created by others, but also when their participation in others’ content creation includes wholly automated features of a website that are coded into its architecture.⁶⁸

There are many examples of courts faithfully applying the plain language of Section 230(f)(3) to hold websites liable for complicity in the creation or development of illegal third-party content. In its 2016 decision in *Federal Trade Commission v. Leadclick Media, LLC*, the Second Circuit Court of Appeals rejected a claim of Section 230 immunity by an internet marketer relying on the fact that it did not create the illegal content at issue, and the content did not appear on its website.⁶⁹ The court noted that while this was so, the internet marketer gave advice to the content creators. This made them complicit in the development of the illegal content. As a result, they were not entitled to Section 230 immunity.

In *FTC v. Accusearch*, the Tenth Circuit Court of Appeals held that a website’s mere posting of content that it had no role whatsoever in creating—telephone records of private individuals—constituted “development” of that information, and so deprived it of Section 230 immunity.⁷⁰ Even

66 47 U.S.C. § 230(f)(3) provides: “*Information content provider*. The term ‘information content provider’ means any person or entity that is responsible, in whole *or in part*, for the creation *or development* of information provided through the Internet or any other interactive computer service” (emphasis added).

67 521 F.3d 1157 (9th Cir. 2008).

68 521 F.3d 1168 (9th Cir. 2008).

69 838 F.3d 158 (2d Cir. 2016).

70 570 F.3d 1187, 1197 (10th Cir. 2009).

though the content was wholly created by others, the website knowingly transformed what had previously been private information into a publicly available commodity. Such complicity in illegality is what defines “development” of content, as distinguished from its creation.

Other notable examples of this now well-established application of Section 230 are *Enigma Software Group v. Bleeping Computer*, in which a website was denied immunity despite the fact it did not create the unlawful content at issue, because of an implied agency relationship with an unpaid volunteer who did create it;⁷¹ and *Alvi Armani Medical, Inc. v. Hennessey*, in which the court found a website to be complicit in content creation because of its alleged knowledge that postings were being made under false identities.⁷²

In its 2016 decision in *Jane Doe v. Backpage.com*,⁷³ however, the First Circuit Court of Appeals cast itself as an outlier, rejecting the holding in *Roommates.com* and its progeny. Instead, it held that “claims that a website facilitates illegal conduct through its posting rules necessarily treat the website as a publisher or speaker of content provided by third parties and, thus, are precluded by section 230(c)(1).”⁷⁴ This holding completely ignores the definition in subsection (f)(3) of Section 230, which clearly provides that anyone—including a website—can be an “information content provider” if they are “responsible, in whole or in part, for the creation or development” of online content. The broad protection against being treated as a publisher, as is stated clearly in Section 230(c)(1), applies only with respect to online content provided by *another* information content provider.

Despite the fact that the First Circuit holding was out of step with other decisional law in this respect, the *Backpage* litigation gained great notoriety because the Backpage.com website was widely reported to be criminally involved in sex trafficking. The massive media attention to the case and its apparent unjust result gave rise to the notion that Section 230 routinely operates as a shield against actual wrongdoing by websites. In fact, the opposite is the case: other courts since 2016 have uniformly followed the *Roommates* precedent and increasingly have expanded the circumstances in which they are willing to find websites complicit in the creation or development of illegal content provided by their users.⁷⁵

Ironically, the actual facts in the *Backpage* case were a Technicolor display of complicity in the development of illegal content. Backpage knowingly concealed evidence of criminality by systematically editing its adult ads; it coached its users on how to post “clean” ads for illegal transactions; it deliberately edited ads in order to facilitate prostitution; it prescribed the language used in ads for prostitution; and it moderated content on the site not to remove ads for prostitution, but

74 *Jane Doe No. 1 v. Backpage.com, LLC*, 817 F.3d 12 at 22 (1st Cir. 2016)(emphasis added).

75 *J.S. v. Village Voice Media Holdings, LLC*, is a representative example, also involving Backpage.com. Stating the test of Section 230, the court held that Backpage would not be a content creator under § 230(f)(3) if it “merely hosted the advertisements.” But if “Backpage also helped develop the content of those advertisements,” then “Backpage is not protected by CDA immunity.” *J.S. v. Village Voice Media Holdings, LLC*, at 717. As in *Roommates.com*, where the website itself was designed so as to yield illegal content, the court cited the allegations that Backpage’s “content requirements are specifically designed to control the nature and context of those advertisements,” so that they can be used for “the trafficking of children.” Moreover, the complaint alleged that Backpage had a “substantial role in creating the content and context of the advertisements on its website.” In holding that Backpage was a content creator on the basis of the allegations in the complaint, the court expressly followed both the *Roommates* holding and the clear language of Section 230 itself. “A website operator,” the court concluded, “can be both a service provider and a content provider,” and when it is a content provider, it no longer enjoys Section 230 protection from liability. *J.S. v. Village Voice Media Holdings, LLC*, at 717–18.

to camouflage them. It is difficult to imagine a clearer case of complicity “in part, for the creation or development” of illegal content.⁷⁶ Unfortunately, the First Circuit found that the Jane Doe plaintiffs, “whatever their reasons might be,” had “chosen to ignore” any allegation of Backpage’s content creation. Instead, the court said, the argument that Backpage was an “information content provider” under Section 230 was “forsworn” by the plaintiffs, both in the district court and on appeal. The court regretted that it could not interject that issue itself.⁷⁷

Happily, even within the First Circuit, this mistake has now been rectified. In the 2018 decision in *Doe v. Backpage.com*, a re-pleading of the original claims by three new Jane Doe plaintiffs, the court held that allegations that Backpage changed the wording of third-party advertisements on its site was sufficient to make it an information content provider, and thus ineligible for Section 230 immunity.⁷⁸ Much heartache could have been avoided had the facts concerning Backpage’s complicity been sufficiently pleaded in the original case and had the court reached this sensible and clearly correct decision on the law in the first place.

Equally misguided as the notion that Section 230 must shield wrongdoing are assertions that Section 230 was never meant to apply to e-commerce.⁷⁹ To the contrary, removing the threat to e-commerce represented by the *Prodigy* decision was an essential purpose in the development and enactment of Section 230. When Section 230 became law in 1996, user-generated content was already ubiquitous on the internet. The creativity being demonstrated by websites and users alike made it clear that online shopping was an enormously consumer-friendly use of the new technology. Features such as CompuServe’s “electronic mall” and Prodigy’s mail-order stores were instantly popular. So too were messaging and email, which in Prodigy’s case came with per-message transaction fees. Web businesses such as CheckFree demonstrated as far back as 1996 that online bill payment was not only feasible but also convenient. Prodigy, America Online, and the fledgling Microsoft Network included features we know today as content delivery, each with a different payment system. Both Rep. Wyden and I had all of these iterations of internet commerce in mind when we drafted our legislation. We made this plain during our extensive outreach to members of both the House and Senate during 1995 and 1996.

Yet another common misconception about the coverage of Section 230 is that it created one rule for online activity and a different rule for the same activity conducted offline.⁸⁰ To the contrary, Section 230 operates to ensure that like activities are always treated alike under the law. When Section 230 was written, just as now, each of the commercial applications flourishing online had an analog in the offline world, where each had its own attendant legal responsibilities. Newspapers could be liable for defamation. Banks and brokers could be held responsible for failing to know

76 These facts are laid out in considerable detail in the Staff Report of the Senate Permanent Subcommittee on Investigations, Backpage.com’s Knowing Facilitation of Online Sex Trafficking, January 2017, <https://www.hsgac.senate.gov/imo/media/doc/Backpage%20Report%202017.01.10%20FINAL.pdf>.

77 *Jane Doe No. 1 v. Backpage.com, LLC*, 817 F.3d 12 (1st Cir. 2016), 19 n.4.

78 *Doe No. 1 v. Backpage*, 2018 WL 1542056 (D. Mass. March 29, 2018).

79 For example: “The internet has changed dramatically in the 25 years since Section 230’s enactment in ways that no one, including the drafters of Section 230, could have predicted Platforms no longer function as simple forums for posting third-party content, but instead ... engage in commerce.” US Department of Justice, Review of Section 230 of the Communications Decency Act of 1996, June 17, 2020. See also Cathy Gellis, “The Third Circuit Joins the Ninth in Excluding E-Commerce Platforms from Section 230’s Protection,” *Techdirt*, July 15, 2019, <https://www.techdirt.com/articles/20190709/13525442547/third-circuit-joins-ninth-excluding-e-commerce-platforms-section-230s-protection.shtml>.

80 See, for example, Chris Reed, “Online and Offline Equivalence: Aspiration and Achievement,” *International Journal of Law and Information Technology* 18, no. 3 (Autumn 2010): 248, 252 and n.22. Here, Reed characterizes Section 230 as enforcing “rules which apply only online.... [T]he result may well have been to favour online publishing over offline in some circumstances”.

their customers. Advertisers were responsible under the Federal Trade Commission Act and state consumer laws for ensuring their content was not deceptive and unfair. Merchandisers could be held liable for negligence and breach of warranty, and in some cases even subjected to strict liability for defective products.

In writing Section 230, Rep. Wyden and I, and ultimately the entire Congress, decided that these legal rules should continue to apply on the internet just as in the offline world. Every business, whether operating through an online facility or through a brick-and-mortar facility, would continue to be responsible for all of its *own* legal obligations. What Section 230 added to the general body of law was the principle that an individual or entity operating a website should not, in addition to its own legal responsibilities, be required to monitor all of the content created by third parties and thereby become derivatively liable for the illegal acts of others. Congress recognized such a requirement would jeopardize the quintessential function of the internet: enabling millions of people around the world to communicate simultaneously and instantaneously. Congress wished to “embrace” and “welcome” this function, not only for its commercial potential but also for “the opportunity for education and political discourse that it offers for all of us.”⁸¹ The result is that websites are protected from liability for user-created content, but only if they are wholly uninvolved in the creation or development of that content. Today, nearly every substantial brick-and-mortar business of any kind, from newspapers to retailers to manufacturers to service providers, has an internet presence as well through which it conducts e-commerce. The same is true for the vast majority of even the smallest businesses.⁸² The same legal rules and responsibilities apply across the board to all.

It is worth debunking three other “creation myths” about Section 230. The first is that Section 230 was conceived as a way to protect an infant industry.⁸³ According to this narrative, in the early days of the internet, Congress decided that small startups needed protection. Now that the internet has matured, it is argued, the need for such protection no longer exists; Section 230 is no longer necessary. As co-author of the legislation, I can verify that this is an entirely fictitious narrative. Far from wishing to offer protection to an infant industry, our legislative aim was to recognize the sheer implausibility of requiring each website to monitor all of the user-created content that crossed its portal each day. In the 1990s, when internet traffic was measured in the tens of millions, this problem was already apparent. Today, in the third decade of the 21st century, the enormous growth in the volume of traffic on websites has made the potential consequences of publisher liability far graver. Section 230 is needed for this purpose, now more than ever.

The second “creation myth” is that Section 230 was adopted as a special favor to the tech industry, which lobbied for it on Capitol Hill and managed to wheedle it out of Congress by working the

81 104th Cong., 1st Sess., 141 Cong. Rec. Part 16, 22045 (August 4, 1995)(remarks of Rep. Cox).

82 About two-thirds (64 percent) of US small businesses have websites, while nearly a third (29 percent) planned to begin using websites for the first time in 2020. Sandeep Rathore, “29 percent of Small Businesses Will Start a Website This Year,” Small Business News, February 6, 2020, <https://smallbiztrends.com/2020/02/2020-small-business-marketing-statistics.html>.

83 For example: “Congress enacted Section 230 ... as a subsidy to the infant industry of the Internet,” Michael L. Rustad, “The Role of Cybertorts in Internet Governance,” in *The Comparative Law Yearbook of International Business*, ed. Dennis Campbell (Alphen aan den Rijn, Netherlands: Wolters Kluwer, 2018), 391, 411; and “Section 230 was intended as an ‘exception for an infant industry,’” Mark Schultz, “Is There Internet Life after 30?,” *The Hill*, August 23, 2019, <https://thehill.com/blogs/congress-blog/technology/458620-is-there-internet-life-after-thirty>. See generally Marc J. Melitz, “When and How Should Infant Industries Be Protected?,” *Journal of International Economics* 66, no. 1 (May 2005): 177–96.

system.⁸⁴ The reality is far different. In the mid-1990s, internet commerce had very little presence in Washington. The impetus for the legislation was the *Prodigy* decision itself, which I learned of through news reports. No company or lobbyist contacted Rep. Wyden or me. That included the leading internet services of the day, Prodigy and CompuServe, whose lawsuits inspired our efforts. As a result, our discussions of the proposed legislation with our colleagues in the House and Senate were unburdened by importunities from businesses seeking to gain a regulatory advantage over their competitors. I willingly concede that this was, therefore, a unique experience in my lawmaking career. It is also the opposite of what Congress should expect if it undertakes to amend Section 230, given that today millions of websites and hundreds of millions of internet users have an identifiable stake in the outcome.

The final creation myth is that Section 230 was part of a grand bargain with Senator James Exon (D-NE), in which his Communications Decency Act aimed at pornography was paired with the Cox-Wyden bill (the Internet Freedom and Family Empowerment Act) aimed at green-lighting websites to adopt content moderation policies without fear of liability.⁸⁵ The claim now being made is that the two bills were actually like legislative epoxy, with one part requiring the other. And since the Exon legislation was subsequently invalidated as unconstitutional by the US Supreme Court, so the argument goes, Section 230 should not be allowed to stand on its own. This revisionist argument goes so far as to claim that the primary congressional purpose back in 1996 was not to give internet platforms limited immunity from liability as Section 230 does; rather, the most important part of the imagined “package” was Senator Exon’s radical idea of imposing stringent liability on websites for the illegal acts of others⁸⁶—an idea that Exon himself backed away from before his amendment was actually passed.⁸⁷ The conclusion of this argument is that, since the Supreme Court threw out the Exon bathwater, the Section 230 baby should be thrown out, too.

The reality, however, is far different than this revisionist history would have it. The facts all speak loudly to that point: the Cox-Wyden bill was designed as an alternative to the Exon approach; the Communications Decency Act was uniformly criticized during the House debate by members of both parties, and not a single representative spoke in support of it; the vote in favor of the Cox-Wyden amendment was 420–4; and the House version of the Telecommunications Act included the Cox-Wyden amendment while pointedly excluding the Exon amendment. The Communications Decency Act was never a necessary counterpart to Section 230.

84 See, e.g., Richard Hill, “Trump and CDA Section 230: The End of an Internet Exception?,” Bot Populi, July 2, 2020 (“Internet service providers lobbied to have a special law passed that would allow them to monitor content without becoming fully liable for what they published. The lobbying was successful and led to the US Congress adopting Section 230”), <https://botpopuli.net/trump-and-cda-section-230-the-end-of-an-internet-exception>; Felix Gillette, “Section 230 Was Supposed to Make the Internet a Better Place. It Failed,” Bloomberg Businessweek, August 7, 2019, <https://www.bloomberg.com/news/features/2019-08-07/section-230-was-supposed-to-make-the-internet-a-better-place-it-failed> (claiming that Section 230 was the result of “influential [lobbying] of technophobes on Capitol Hill” that included “organizing protests”).

85 See, for example, Hawley, “True History.”

86 Hawley, “True History.”

87 In an effort to address criticisms from objecting senators, the final version of the Exon amendment, as it was incorporated into the Telecommunications Act of 1996, lessened the criminal exposure of websites and online service providers through the addition of four new defenses. This caused the Clinton administration to complain that the revised Exon legislation now defeated its own purpose by actually making criminal prosecution of obscenity more difficult. It “would undermine the ability of the Department of Justice to prosecute an on-line service provider,” the Justice Department opined, “even though it knowingly profits from the distribution of obscenity or child pornography.” 104th Cong., 1st Sess., 141 Cong. Rec. Pt. 11, 16023 (June 14, 1995)(letter from Kent Markus, Acting Assistant Attorney General, Department of Justice, to Senator Patrick Leahy).

Section 230 and the First Amendment

Today, there are understandable complaints that particular social media platforms moderate user content in tendentious ways. But to the extent that a platform moderates content for purely political reasons, as for example when political party websites prefer views they agree with and ban their opponents' posts, it is not Section 230 but the First Amendment that empowers them to do so. Nor does Section 230 protect websites from liability for their own speech. Indeed, it does not even protect them when they are complicit, even in part, in the development of users' speech.⁸⁸

In the European Union, by contrast, there is no tradition of First Amendment-style protection of private speech from government regulation. The EU Digital Markets Act and Digital Services Act give the state the right to monitor speech based on far more subjective standards than the First Amendment would permit. Farther east in Iran, Saudi Arabia, Russia, China, Vietnam, and North Korea, governments not only censor independent speech but also turn the power of the internet against the citizenry, employing digital censorship and surveillance techniques to silence and punish critics.

Content moderation, by its very nature, requires that platforms exercise editorial discretion when they remove objectionable content. The decisions to adopt and enforce standards governing online content are themselves decisions whether to publish certain content and under what conditions. It was because the Prodigy holding would subject platforms to liability for engaging in content moderation that Congress created the limited "Good Samaritan" safe harbor in Section 230. The statute provides liability safeguards necessitated by the enormous volume of user-created content on platforms.

Because content moderation is a form of editorial speech, the First Amendment more fully protects it beyond the specific safeguards enumerated in Section 230. Properly understood, Section 230 complements the First Amendment and is entirely compatible with it. The First Amendment's protection for the editorial discretion that is inherent in content moderation naturally extends to platforms that moderate user content. A platform need not be a "mere conduit" to benefit from this protection, as some have argued. Nor does it lose First Amendment protection when it engages in its own speech in ways that are not protected under Section 230. To the contrary, content moderation is a platform's own speech everywhere and always, and is for that reason protected by the First Amendment. To be sure, platforms may not engage in their own speech when government lawfully restricts it within the bounds of the First Amendment. But those boundaries are long established and operate independently of Section 230.

The current debate over content moderation, at once faulting platforms for overbreadth and inadequacy, must be understood as fundamentally a debate about the application of the First Amendment. Were Section 230 to disappear, a platform would remain protected by the First Amendment from liability for exercising its discretion to restrict content. Its new liability exposure would not be for such content moderation, but for hosting others' content without thoroughly vetting it. That of course would revivify what Section 230 scholar Jeff Kosseff, a professor of cyber law at the United States Naval Academy, calls "the bizarre First Amendment rule articulated in

⁸⁸ 47 U.S.C. § 230(f)(3).

Cubby⁸⁹ and Stratton Oakmont,⁹⁰ in which moderating content might increase their liability.”⁹¹ In such a world, the opportunities for individuals both to create and publish their own content, and to enjoy the content created by millions of others—the essence of the modern internet—would be much diminished. The internet, Kosseff posits, would be reduced to little more than words, pictures, and videos provided by companies, bereft of interaction among users. Once again, the average citizen’s only means of public expression would be writing a letter to the editor, hoping against hope it might get published. Losing Section 230 would thus deprive us of much in the way of knowledge and new ideas that we have increasingly benefited from over the last quarter century.

Can Section 230 Be Improved?

What we know now is that on a scale barely imaginable even to the internet’s strongest champions when Section 230 was enacted, the medium has come to be defined by user-created content. Wikipedia, which did not exist before Section 230 came into existence, now contains over six million articles in the English version, written and edited entirely by users at the rate of more than two individual edits every second. It is free to everyone with an internet connection. More than 1.7 *billion* unique visitors consult it every month. E-commerce is now driven by user content; a parade of marketing studies has established that the vast majority of retail consumers rely on customer reviews. Hundreds of the most popular social media websites connect friends and family exchanging news and views. By 2020 it was thought that the billions of social media content creators had finally reached the saturation point; but then the global pandemic hit, making those virtual connections more important than ever. Today tens of millions of websites featuring user-created content cater to every conceivable human interest. Google, Bing, Duck Duck Go, and other online search engines continuously crawl the world’s websites and, in response to almost any question we can think of, instantaneously link us to all of this user-created content.

We also know that by empowering billions of people to speak their minds, we have unleashed the whirlwind. The law that gives to anyone and everyone the opportunity to say what they will—limited only by what the platforms hosting this speech find objectionable—has come with costs in the form of obnoxious speech, dangerous speech, hate speech, and violent speech. Do the unquestioned benefits of user-created internet content outweigh these very real costs? Can Section 230 be improved?

After more than 25 years of experience with the law, the answer is yes, but only if lawmakers are careful not to undo the essential elements that make Section 230 work. Congress likely did not intend—I certainly did not—that when a platform is notified by a court that material on its site has been adjudged defamatory, the platform could thumb its nose and refuse to take down the offending content. The law as written does not shield this conduct, nor should it. But over vigorous dissent, California’s highest court has held otherwise. Even when a court has adjudged content to be libelous, and state law would normally require taking it down, the state-court justices ruled that Section 230 protects a platform’s decision to do nothing—even in the face of a court order.⁹²

92 *Hassell v. Bird*, 5 Cal. 5th 522, 234 Cal. Rptr. 3d 867, 420 P.3d 776 (2018).

If I were transported back to 1996 and still holding the pen, I would tweak Section 230 to ensure it could not be interpreted to produce unjust results such as this.

Another judicially created problem is that platforms have sometimes been shielded from legal liability even when they themselves were involved in creating or developing the content at issue. That is certainly not what the statute says. Since 2008, when the United States Court of Appeals for the Ninth Circuit corrected this interpretive error in *Roommates.com*, most other courts have avoided this error as well. Had I seen this coming in 1996, I would have added a few more words to Section 230, or perhaps bolded the words in Section 230(f)(3) that are already there, to state even more clearly that platforms can be content creators or developers themselves, and when they are, they have no protection from liability.

A handful of spurious issues have arisen around Section 230 over the last quarter century. It is frequently asserted that Section 230 shields a platform when it exercises purely political bias. No court has said this. So, even knowing what we know now, I would not necessarily do anything differently were I somehow transported back to 1996 like Marty McFly. The First Amendment gives wide latitude to private platforms that choose to prefer their own political viewpoints. Congress can (in the words of the First Amendment) “make no law” to change this result.

The same holds true for demands that Section 230 be interpreted to require “viewpoint neutrality.” Section 230 governs millions of internet platforms that host user-created content. Asking them all to follow government neutrality guidelines goes beyond impracticability to impossibility. May the Democratic National Committee and Republican National Committee no longer have websites featuring user-created content? Must they host political speech they disagree with? Section 230 does not require political neutrality because, as is stated in its preamble, the internet we envisioned consists of a “vibrant and competitive free market” that, far better than government speech controls, is capable of enabling “a true diversity of political discourse, unique opportunities for cultural development, and myriad avenues for intellectual activity.”

Legislative proposals to put state attorneys general in charge of determining when a platform has violated a nebulous “viewpoint neutrality” standard are likely to violate the First Amendment. But constitutional issues aside, they suffer from another serious design flaw. Such proposals might satisfy partisan political appetites in the short run, but they are certain to give rise to even louder complaints of censorship and bias from the same quarters when, inevitably, the political party with which one disagrees inherits the power to intimidate platforms by instituting sweeping investigations into content moderation standards and practices.

Supreme Court Justice Clarence Thomas has raised, albeit in dicta, a series of questions concerning Section 230 that all go to statutory interpretation. My experience as an interested observer of judicial interpretation of the law over the last quarter century is that a handful of high-profile decisions misconstruing the plain language of Section 230 are responsible for most if not all of the angst over the manner of its application. In this category I would include the early First Circuit and trial court decisions in *Backpage.com* (later corrected in 2018); the California Supreme Court’s decision in *Hassel v. Bird*; and the Ninth Circuit’s decision in *Batzel v. Smith* (effectively distinguished out of existence in pertinent part by the later Ninth Circuit *en banc* in *Roommates.com*).⁹³ For the most part, courts have gotten it right. But these outlier cases with outsize notoriety have in common that they failed to apply the statute as written.

⁹³ *Batzel v. Smith*, 351 F. 3d 904 (9th Cir. 2003).

Justice Thomas alludes to this when, in his concurrence respecting denial of certiorari in *Doe v. Facebook*, he says that “courts have uniformly treated internet platforms as ‘publisher[s]’ under §230(c)(1)” whenever a claim stems from information created by third parties.⁹⁴ The statute says something else. Section 230(c)(1) plainly describes the circumstances in which a platform will be treated as if it is *not* a publisher. In order for (c)(1) protection to apply, the platform must not be “responsible, in whole or in part, for the creation or development” of the content at issue. §230(f)(3). When a platform does play that creative or developmental role, even if only partly, there is no protection from liability under Section 230. Platforms need not be classified as a publisher, or “like a publisher,” or as a passive conduit in order to apply the statute. That is not what the statute says and therefore not how it works.

Justice Thomas goes on to observe that an “expansive” reading of Section 230 would require dismissal of claims against internet companies for product defects. But by not stretching the words of the statute beyond their ordinary meaning, lower courts seem increasingly to be handling this question without difficulty. *Roommates.com* correctly distinguished between what the defendant had coded into its platform on the one hand, and what was independently provided by users on the other hand. More recently, in *Lemmon v. Snap, Inc.*, the Ninth Circuit upheld a complaint alleging product defects, holding that it was not preempted by Section 230.⁹⁵ The statute does not and was never intended to shield internet platforms from liability in all cases, and *Lemmon v. Snap* is a straightforward example of this. Conversely, in those cases where Section 230 protection does apply, it is *not* because platforms are being “treated ... as ‘publisher[s].’” To the contrary, it is because the offending content is provided by users, and the platform is not complicit in its creation or development.

The early Ninth Circuit case of *Batzel v. Smith* well illustrates what can go wrong when courts fail to adhere to the statutory language. The case involved a one-man website. The offending content was a defamatory email the website operator received in his personal email account. Without the knowledge of the email’s author, he chose to publish the defamatory material on his own website, edited it by making wording changes to the email, and embellished it by enlarging the defamation with his own content. A clearer case of a platform being “responsible, in whole or in part, for the creation or development of information” is difficult to imagine. Therefore the website operator was himself a content creator under (f)(3) and ineligible for protection under (c)(1). This case may represent an “expansive” reading, to use Justice Thomas’s language, but it is simpler to see it as a failure to apply the statute. Happily, the Ninth Circuit moved on to sturdier ground in later cases.

In his statement accompanying the denial of certiorari in another case, *Malwarebytes, Inc. v. Enigma Software*, Justice Thomas makes the inarguable point that “[e]xtending §230 immunity beyond the natural reading of the text can have serious consequences.”⁹⁶ Observing that courts too often have overlooked (f)(3), he specially singles out *Batzel* as an offender in this regard: “To say that editing a statement and adding commentary in this context does not ‘creat[e] or develo[p]’ the final product, even in part, is dubious.” The remedy, since the source of the problem is judicial misapplication of a fairly easy-to-read statute, is for courts consistently to apply the statute as

94 *Doe v. Facebook, Inc.*, 595 U.S. ___ (2022)(statement of Thomas, J., respecting denial of certiorari).

95 995 F.3d 1085 (9th Cir. 2021).

96 *Malwarebytes, Inc. v. Enigma Software Group USA, LLC*, 592 U.S. ___ (2020)(statement of Thomas, J., respecting denial of certiorari).

written. Instead of applying only the famous “twenty-six words,” a reference to Section 230(c)(1), courts should apply all 955 words.⁹⁷

Given all that we have learned by way of real-world experience since Section 230 was enacted, there are tweaks I might be tempted to make to my own legislative handiwork if I were still in Congress. But then again, I might restrain myself, knowing as I do now the many aspects of the modern internet that we have come to take for granted and that are dependent upon Section 230’s protections. Even though it is possible to imagine that a “perfect” bill could improve Section 230 while preserving its benefits, I have seen the sausage-making process up close. It is just as likely that instead of perfecting Section 230, opening the door for more changes would threaten the essential elements that we now know have made it work. On balance, I would offer that same advice to those in Congress today who continue to wrestle with these very problems.

Conclusion

The history of Section 230 is especially relevant today, as Americans for whom the internet is now a ubiquitous feature of daily life grapple with the same issues of content moderation, privacy, free speech, and the dark side of cyberspace that challenged policymakers in 1995–96. In the current 117th Congress, there is a noticeable resurgence of support for government regulation of content, with all that portends.

Today’s “techlash” and neo-regulatory resurgence is fueled by the same passions and concerns from 25 years ago, including protecting children, as well as the more recent trend toward restricting speech that may be offensive to some segments of the adult population. In June 2020, the *New York Times* fired its opinion editor, ostensibly for publishing an op-ed by a sitting Republican US senator on a critical issue of the day.⁹⁸ Supporters of former President Donald Trump complained when Twitter moved to fact-check and contextualize his tweets,⁹⁹ while progressives complained that Facebook was not doing this¹⁰⁰ and applauded when Twitter permanently banned him.¹⁰¹ Senators and representatives are writing legislation that would settle these arguments through force of law rather than private ordering, including legislation to walk back the now prosaically named Section 230.

In these legislative debates, James Exon’s misguided handiwork is often romanticized by the new wave of speech regulators. Recalling its deep flaws, myriad unintended consequences, and dangerous threats to both free speech and the functioning of the internet is a worthwhile reality check.

Not only is the notion that the Communications Decency Act and Section 230 were conceived together completely wrong, but so too is the idea that the Exon approach enjoyed lasting congressional support. By the time the Telecommunications Act completed its torturous legislative

journey, support for the Communications Decency Act had dwindled even in the Senate, as senators came to understand the mismatch between problem and solution that the bill represented. With the exception of its most passionate supporters, few tears were shed for the Exon legislation at its final demise in 1997. James Exon had retired from the Senate even before his law was declared unconstitutional, leaving few behind him willing to carry the torch. His colleagues made no effort to “fix” and replace the Communications Decency Act after it was unanimously struck down by the Supreme Court.

Meanwhile Section 230, originally introduced in the House in June 1995 as freestanding bill H.R. 1978, stands on its own, now as then. Its premise of imposing liability on criminals and tortfeasors for their own wrongful conduct, rather than shifting that liability to third parties, operates independently of (and indeed, in opposition to) Senator Exon’s approach that would directly interfere with the essential functioning of the internet.

In the final analysis, it is useful to place this legislative history in contemporary context. Imagine returning to a world without Section 230, as some today are urging. In this alternative world, websites and internet platforms of all kinds would face enormous potential liability for hosting content created by others. They would have a powerful incentive to limit that exposure, which they could do in one of two ways. They could strictly limit user-generated content, or even eliminate it altogether; or they could adopt the “anything goes” model through which CompuServe originally escaped liability before Section 230 existed. We would all be very much worse off were this to happen. Without Section 230’s clear limitation on liability, it is difficult to imagine that most of the online services on which we rely every day would even exist in anything like their current form. While courts will continue to grapple with the challenges of applying Section 230 to the ever-changing landscape of the 21st century internet, hewing to its fundamental principles and purposes will be a far wiser course for policymakers than opening the Pandora’s box of unintended consequences that could so easily follow from upending the law.
